ACKNOWLEDGEMENT

I would like to take a moment to show my deepest appreciation to everyone who assisted in the successful completion of this project.

To begin with, I would like to express my sincere gratitude to Mr. Desmond, who provided invaluable guidance to us with all the technical knowledge, and support during the entire period of this project. His comments contributed greatly to our success in getting through the process of the project and ensuring that our work was of high quality.

I am also incredibly grateful to my dedicated team members, Jason and Vannesia. Their hard work and dedication towards this project were crucial. Each member's contribution was vital to the integration of the system's various modules. This was an actual teamwork; through their efforts, innovative problem solving and the focus on the development process was efficient and gratifying.

Finally, I thank all those who provided encouragement and support during the research and coding phases of this project.

ABSTRACT

This project shows the development of Flash Hotel Booking Management. It is a responsive web-based design designed to automate and streamline hotel reservations and administrative systems. This project addresses issues that are common with manual or outdated systems such as human error and customer dissatisfaction.

This system will feature a secure online portal that allows customers to check real-time room availability, view room details, and instantly finalize bookings.

Furthermore, the centralized admin portal will enable the hotel staff and admins to efficiently manage reservations, update room statuses, and maintain guest records without manual paperwork.

The objective of this project is to lessen physical labor and human error as well as increase operational efficiency and improve customer satisfaction.

Part I:

Introduction

1.1 Overview

The flash hotel management system focuses on automating hotel reservations and management through the hotel management system that we have created. In today's technology, digital transformation has significantly influenced the hospitality industry which includes hotels adopting online bookings and management systems making a better change to efficiently carry out and streamline operations as well as enhance customer services.

This system is created to fit essential hotel activities such as room reservations, payment processing, and guest record management. With that, customers can check for room availability, view room prices amenities and instantly able to book rooms instantly through a secure online portal. Simultaneously, the hotel administrators and staff can handle reservations, update room statuses, and manage the guest records without relying on manual paperwork.

By using the hotel booking management system, it will also help with providing real-time data and secure transactions as it not only increases operational efficiency but also ensures customer satisfaction. Its responsive web design allows access from desktops as it aligns with the current technology and user experience in the hotel industry.

1.2 Project Objectives

The primary goals of Our Hotel Management System are outlined in this section. By combining several hotel-related procedures into a single, centralized platform, the system is intended to optimize hotel operations, enhance overall management efficiency, and improve customer experience. The following is a summary of the project's goals:

1. To lessen the amount of physical labor and human error involved in handling routine hotel tasks like booking rooms, checking guests in and out, paying and maintaining records. The suggested system will automate these procedures to reduce reliance on manual documentation, which frequently results in errors and inconsistent data. By automating these processes, hotel employees can carry out their duties more precisely and efficiently, resulting in better daily management and quicker client service.
2. To increase operational efficiency by creating a centralized management system that unifies all hotel operations into a single, user-friendly interface, including room reservations, customer service, payment system and reporting. This goal is to decrease the amount of time needed for regular administrative chores, improve departmental coordination, and provide hotel employees and administrators with fast access to real-time information. Better communication, quicker decision-making, and increased production throughout the company are all outcomes of the enhanced workflow.
3. To improve customer satisfaction by offering a cutting-edge, user-friendly online booking system that makes it simple for visitors to peruse available rooms, read thorough descriptions, verify costs, and quickly finalize reservations. Through a responsive online interface that is available anywhere, at any time, the system seeks to improve user ease. This guarantees that visitors may easily finish the booking process and get immediate confirmation, making their stay at the hotel more pleasurable and fulfilling.

4. To enhance data accuracy, security, and accessibility by storing all guest, booking and payment information in a secure, well-structured database system. This objective aims to ensure that sensitive customer and financial data is properly protected against unauthorized access or loss. Regular backups and secure authentication methods will be implemented to maintain data integrity and confidentiality, while allowing authorized personnel to retrieve necessary information quickly whenever needed.

1.3 Target Users

1) Hotel Admin

Reason: They are the most common users who handle hotel activities like booking, customer information, check-in/ check-out information and room occupancy. The system assists them in conducting daily administrative duties with high efficiency without necessarily using manual paperwork to conduct such duties.

2) Hotel Managers / Owners

Reason: They need to be able to access general hotel performance, reservation records, and revenues. The admin portal makes the operations organized and centralized to assist the managers in making decisions and reporting.

3) Guests / Customers

Reason: Visitors may consider room descriptions, book their rooms, and check room availability on the Internet. This enhances accessibility and convenience which doesn't require to call or visit the hotel physically.

1.4 Project Scope

The scope of the project is the hotel management system encompasses the development of an online platform that covers the entire hotel booking and management process.

System coverage

- Enables the customer to register, log in, browse room details, and make online reservations.
- Allows hotel administration to add, edit, delete room details such as type, price, amenities.
- Automatically updates room availability in real-time after booking confirmation or cancellations.

Limitations

- The system only currently supports one hotel branch and does not handle multiple locations.
- The system does not automate refunds, cancellations request must be manually handled by hotel staff.
- Internet access is required to access and use all system functions.

1.5 Gantt Chart

A Gantt chart outlines what aspects of the project has been completed. The Gantt chart must show the duration taken from Design phase until delivering the Final Report/Presentation for the entire project. You can create Gantt chart in Microsoft Excel, MS Project, SmartDraw or other project management software.

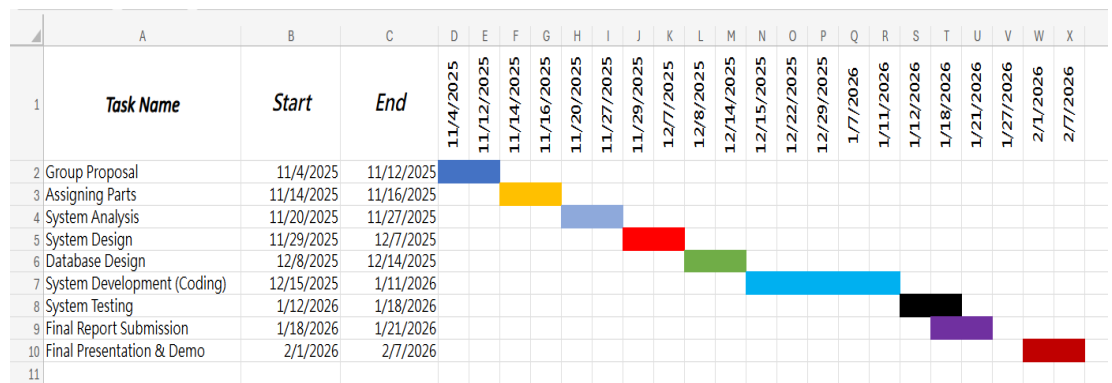

Figure 1:Gantt Chart

1.6 Division of Work

Division of work is very important make sure every member participates in the project development. Some of the tasks such as preparing documentation and background study must be done by all group members. However certain tasks must be delegated to each group member by the group leader.

2 Part II: Primary Study/ Literature Research

2.1 Primary Study

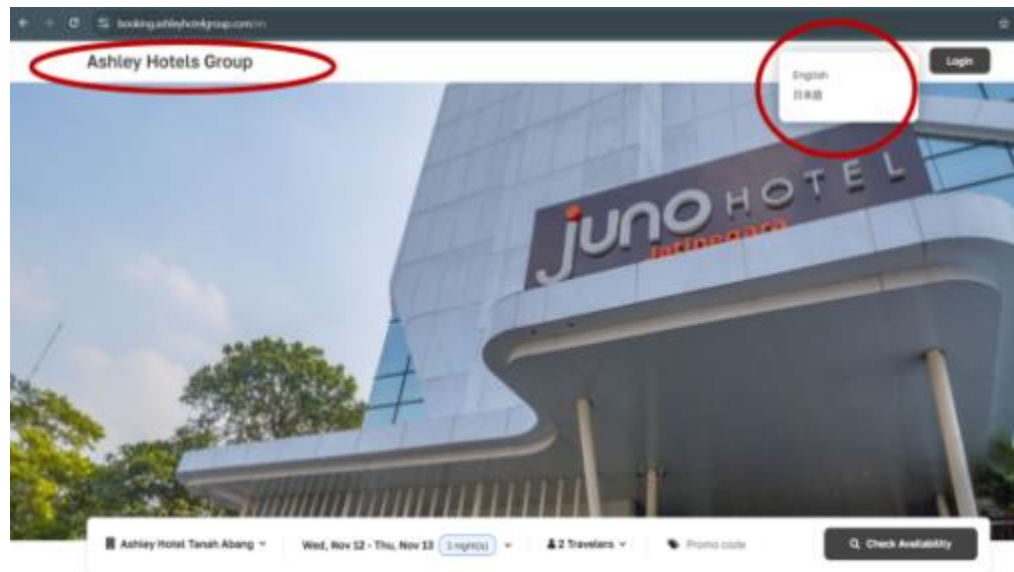

Figure 2 Ashley Hotels Home Page

Figure 2.1.1 shows that the booking website of The Ashley Hotel has a minimalistic design that is aligned with the brand of the hotel. Its versatile design can serve both desktop and mobile users and its simple design makes navigation easy. The site is however slow to load and has limited language options and this may not be very accessible to foreign visitors.

Regarding functionality, the system allows customers to register, log in, search rooms, select dates, and directly book a number of locations of Ashley Hotel. It also provides online payment options and account management, which is convenient. It lacks advanced functionality that would be expected of a larger hotel system, including multi-currency support, loyalty programs, and user rating despite offering very rudimentary booking options.

Advantages

Brand Consistency: The website is highly reminiscent of the Ashley Hotel Group brand, which contributes to increasing the confidence in direct bookings.

Clean and simple UI: simple to read, and does not get cluttered, which might make booking easier.

Many Properties Supported: They have the option of accessing a variety of hotels on the group using a single site.

Disadvantages

Poor Language Support: There is only limited support on the English and Japanese language and the international users might have trouble.

Loading and Performance Problems: The first loading screen can give users a frustrating experience or make them drop off.

There is no obvious multi-currency or location-specific content: this is not so convenient to international visitors.

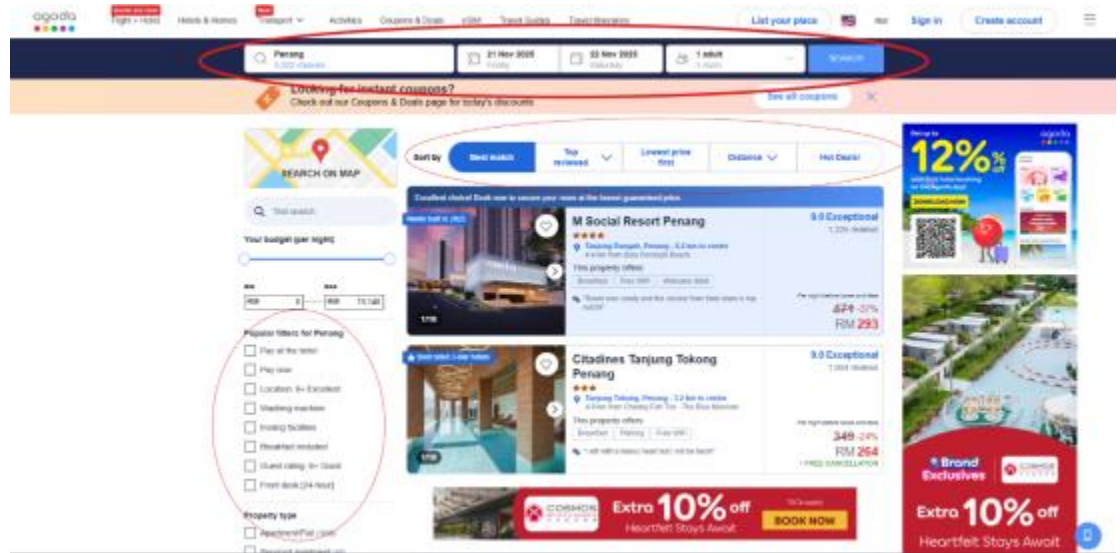

Figure 3 Agoda Booking Page

Figure 3 indicated that the Agoda site has an eye-catching modern design that features the tourist destinations and accommodation with beautiful photographs. The site has a convenient search engine that allows the user to type in their destination, dates of the trip, and the number of people. Besides being equipped with a distinct mobile application, the site is fully responsive, which ensures smooth functionality on desktop and mobile devices.

To provide a more personalized experience, Agoda provides a variety of options in filtering and searching, where customers can focus on the results based on location, rating, price and room type. It will be convenient to the international users since it accommodates various languages and currencies. The site also offers price notification, loyalty programs and account management to enhance consumer interaction. The system has safe online booking and payment functions as well as exclusive offers and discounts to attract repeat customers and ensures reliable transactions.

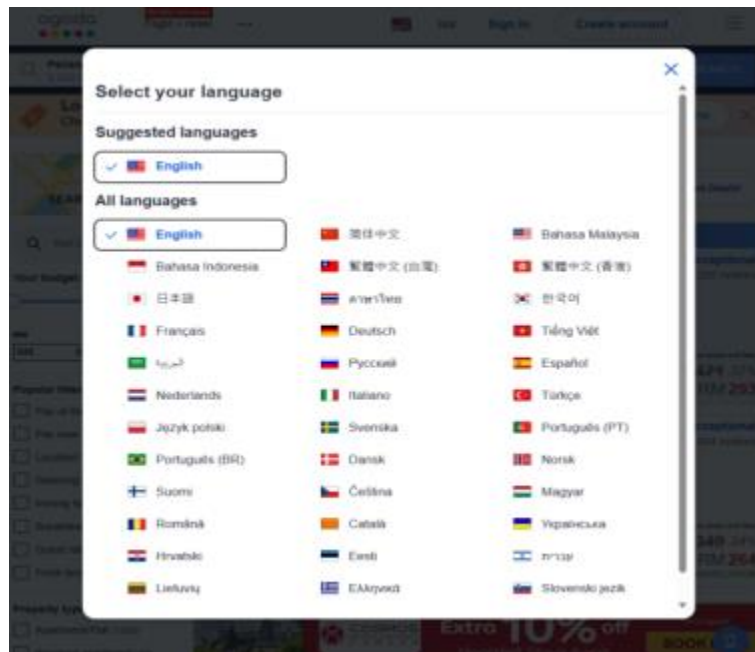

Figure 4 Agoda Language Selection Page

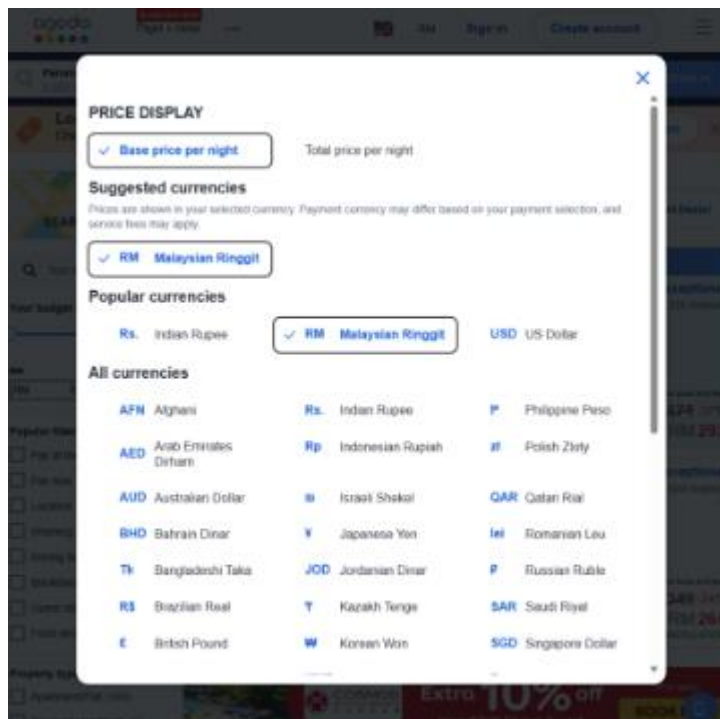

Figure 5 Agoda Currencies Selection Page

Advantages

Wide international presence and language coverage: According to Figure 2.2.2, Agoda is highly reachable to any audience worldwide due to the fact that it offers a variety of languages and properties located in the entire world.

Good value proposition and deals: Agoda puts a high emphasis on offering clients good value deals on any type of accommodation, whether it is cheap or luxurious.

Extensive filter and search features: Customers can quickly find the right accommodation as they can adjust their searches based on many parameters such as location, rating, cost and type of room. At Figure 2.2.3 also reveals that the platform also allows various currency preferences of the various countries, allowing customers to see the prices in their local currency to have easy booking process.

Disadvantages

Overloaded information and complex interface: Novices or less tech-savvy customers will be overwhelmed with the numerous filters, choices, types of property, and offers or miss important information because of the sheer number of filters, options, types of property, and deals.

Transparency and consistency issues: As per certain customer reviews, it has some hidden prices, wrong type of rooms, or reservation issues.

2.2 *Problem Statement*

The hospitality industry currently faces significant operational challenges due to a reliance on manual processes and fragmented management systems. Traditional methods of handling hotel operations often lead to several critical issues:

1. **Inefficient Booking Processes:** Without a centralized online platform, customers find it difficult to view real-time room availability, leading to delays in booking and a loss of potential revenue. Manual bookings are also prone to overbooking or scheduling conflicts.
2. **Lack of Data Integration:** Current manual or semi-automated systems often fail to synchronize customer data with room inventory. This makes it difficult for hotel staff to track room statuses accurately, resulting in poor inventory management.
3. **Fragmented Administrative Oversight:** Admin and staff members often lack a unified dashboard to manage bookings, sub-admin credentials, and room details efficiently. This decentralization slows down response times and increases the workload for management.
4. **Poor Customer Experience:** In the digital age, customers expect a seamless experience—from viewing hotel history and gallery images to booking spa treatments and meeting rooms online. The absence of an integrated system for wellness, events, and special offers prevents the hotel from providing a modern, "all-in-one" service experience.
5. **Human Error in Financial and Data Entry:** Manual entry of customer details and payment processing is highly susceptible to human error, which can lead to incorrect billing, data loss, and security vulnerabilities.

3 Part III: System Design

3.1 System Features

Admin:

- Can log in to the Admin Portal safely.
- Can see every room booking of the users.
- Can add, edit, or delete room information (e.g. room type, price, amenities, capacity).
- Can update real time room availability. Confirm, update or cancel user bookings.
- Can create booking and payment reports to analyse.
- Can access user payment history.
- Can administer user profiles (activate/inactivate).

Customer:

- Can register and log into the User Portal.
- Ability to look at rooms offered and their prices, pictures, facilities available, and capacities.
- Can select a check-in and check-out date.
- Can reserve hotel rooms online.
- Can make secure payment online using the Payment Portal.
- Can make or cancel their bookings.
- Can get confirmation on the screen on completion of booking and paying.

System Features:

- Reactive web-based design (available on desktop, tablet or mobile).
- Online availability of rooms.
- Integration of database to store user information, room and booking details.
- Checking card number, expiry date, CVV and payment forms.
- Online booking management to eliminate cases of double-booking.
- Protected information processing and user identification.

Hardware/Software Requirements

3.1.1 For Developer

We had used Visual Studio code to do all the codes such as PHP,HTML,CSS to make the front end of the website as well as linking the pages together through the software. It was chosen to be used as it could handle many programming languages as well as adapt to any laptop. We had also used Xampp which is a all in one application to setup a server for the website to run PHP and MYSQL web based systems as it is free to download and easy to adapt to.

3.1.2 For User

The software requirements for running the website is using -

- XAMPP to be able to use the server and make sure that the website is visible for the user.
- Visual Studio Code for adhering to the usage of the website and any browsing software of choice in order to use the website such as brave, chrome, microsoft edge and many more.
- As for the hardware requirements for the usage of this system, 8GB RAM, an SSD (256-512GB), and a reliable CPU (like Intel Core i3/i5 or AMD Ryzen 3/5). This was chosen so that the website and content would be smooth for usage and loading.

15	Meeting & Events: User clicks on the “Meeting & Events”.	The system should display information	Meeting & Events information is	Pass

		about event reservations	displayed correctly.	
16	Meeting & Events Reservations: Enter all the information. Click “Confirm Booking Request”.	The system should book successfully.	Events Reservations book successful.	Pass
17	Invalid Meeting & Events Reservation Submission: User submits a reservation form with incomplete information.	The system should display an error message and stop submission.	Error message is displayed and reservation is not submitted.	Pass
18	Wellness & Spa : User clicks on the “Wellness & Spa”.	The system should display spa and wellness service reservations page.	Wellness & Spa reservations page is displayed correctly.	Pass
19	Invalid Wellness & Spa Reservation Submission: User submits a reservation form with incomplete information.	The system should display an error message and stop submission.	Error message is displayed and reservation is not submitted.	Pass

20	Admin Login (Valid Data): Admin enters valid username and password. Clicks “Login” button.	Admin should be able to login successfully and view the admin dashboard.	Admin is able to login and admin dashboard is displayed.	Pass
21	Admin Dashboard Display: Admin views the dashboard after login.	The system should display total occupancy, arriving today, departing today, and pending bookings.	All dashboard information is displayed correctly.	Pass
22	Back to Main Page: User click the “Back to main” button	Should go back to main page	Successfully back to main page	Pass

6 Part VI: Conclusion

6.1 Conclusion

This project has been able to plan and create a successful Hotel Management System, which endeavours to increase the efficiency of the hotel operations, as well as the overall experience of the customers. During the development process, the system was developed to support the main hotel activities that included customer registration and login, room viewing, booking management, payment processing and booking confirmation. The features are those that reduce the amount of manual work, decrease the number of human errors, and enable the hotel staff to be able to handle bookings in a more systematic and organized way.

The system has a user-friendly interface, which allows customers to navigate the available rooms with ease and obtain a reservation as well as finalize the payment online. Simultaneously, it guarantees the security of data management with the help of session management and database integration. With the adoption of this system, the hotel will be able to enhance operational efficiency, time saving, and better services to the customers.

Overall, this project was able to realize its objectives, with Hotel Management System complying with the fundamental demands of an online hotel booking and management system. The project also served to increase the knowledge of the developer on the development of web-based systems, database management and integration of systems.

6.2 Future Enhancements

Although the Hotel Management System fulfills its main objectives, there are several areas that can be improved and enhanced in future development.

Firstly, SMS and email notification features can be added to automatically notify customers about booking confirmations, payment status, check-in reminders, and promotions. This would improve communication between the hotel and customers.

Secondly, an admin dashboard with advanced reporting features can be implemented. This would allow hotel management to view booking statistics, revenue reports, and room occupancy rates in real time, supporting better decision-making.

Additionally, future versions of the system could include room availability management in real time, customer reviews and ratings, and a mobile-friendly or mobile application version of the system to improve accessibility.

In conclusion, with these future enhancements, the Hotel Management System can be further improved to meet industry standards and provide a more comprehensive, efficient, and user-friendly hotel management solution.
